***The book is about the technology and application of Mixed-mode chromatography (MMC). Unlike conventional single-mode HPLC, which resolves the analytes primarily based on their ionic or hydrophobic properties, MMC employs multifunctional stationary phases to exploit at least two modes of interactions (i.e., ionic and hydrophobic) with the analytes and as such often provides resolution that far exceeds that observed with a single-mode process. Over the past two decades, MMC has developed into an important analytical and purification tool in a number of applications in pharmaceutical and biotechnology industries. The technique has been used widely for the analyses of nucleic acids, amino acids, peptides, proteins, glycoproteins, carbohydrates, antibiotics, vaccines, and other products. The purpose of this book is to present a comprehensive survey of mixed-mode chromatography and is intended as a reference guide for graduate students and experienced scientists in pharmaceutical and biotechnology disciplines wishing to gain a deep understanding of this continuously evolving technology. Winner of the Ned Kelly Award for Non-Fiction A true crime classic, Huckstepp investigates the murder of the charismatic young woman who has fascinated Australians since she first appeared on national television to accuse NSW detectives of shooting her boyfriend in cold blood. Throughout her short life, Sallie-Anne Huckstepp lived a dangerous existence. This is a true story, brilliantly told, of someone who was gutsy and determined – and who paid the ultimate price for speaking out against corruption and murder. In 2014, Xoum is proud to rerelease a new edition of this seminal work. HQ 'As gripping as a thriller.' The Northern Star It seems at some point in everyone's life, the thought runs through the mind asking, What happened, how did things change, and how did I get here? Jeff had to confront similar thoughts after he had received Christ as Lord and Savior. He had genuinely been a good kid. He started off in life wanting to like everyone. His easygoing nature attracted his peers to befriend him. In late October 1977, all that began to change. He became self-conscious, shier, and open to the concept of violence, as bullies began to target him. He believed and evidence in the book suggests that a demonic oppression began near Halloween when he was eight years old. The Jeff that was nice seemed to invite fear that had dominated much of his thoughts since he was three years old. This is a coming-of-age cautionary testimony of a good kid dealing with fears and insecurities in the worst self-destructive ways imaginable and a young adult reaching a point of being ready to throw his and other lives away. God, however, had the final say. Hart describes the global structure of production and consumption in the five major capitalist countries and offers a rich comparative history of their***

***industrial policymaking. He concludes that variations in statesocietal arrangements--and the impact these differences have on the creation and diffusion of new technologies--provide the best explanation for divergences in international competitiveness. In Japan, state and business are allied, but labor is marginalized, whereas in Germany, labor and business are allied, and the state is decentralized. Yet both countries have become increasingly competitive because they have developed institutional mechanisms for technology diffusion. France's state-led system, in contrast, is linked with only moderate competitiveness. The decline of competitiveness in the United States and Britain, Hart concludes, may be attributed to state-societal arrangements that have allowed one actor-labor in Britain, business in the United States-to dominate policymaking. Originally published in 1995, this volume looks at the functioning of the vascular endothelium, and the diseases and tissue injury that arise as a result of inflammation and immunological responses. The vascular endothelium is a metabolically highly active layer of cells lining all blood vessel walls. Through its interactions with leucocytes and other mediators, it is central to the development of inflammatory foci and to lymphocyte trafficking around the body. Tissue injury may arise here as a result of abnormal inflammatory or immune responses. The potential for such injury to contribute to autoimmune disease is discussed in this book, particularly in relation to autoimmune vascular***

***disease of the renal, rheumatological and neurological systems, as well as in organ transplantation. This book systemically presents the latest research on lectins, covering all the major topics in the field, including the heterocomplex of lectins and Toll-like receptors, protective versus pathogenic functions in connection with microbial infections, and novel strategies for enhancing host immunity against infectious diseases caused by viruses, bacteria, and fungi. Lectins are a large group of glycan-binding proteins that recognize diverse glycan and non-glycan structures expressed on prokaryotic and eukaryotic cells, and are vital to cell-cell interactions, the attachment of microbes to host cells, and the recognition and activation of immune responses to exogenous and endogenous danger signals. The composition and structure of microbes are complex and include numerous 'pathogen-associated molecular patterns' or 'damage-associated molecular patterns'. As such, microbes' interactions with immune cells activate multiple innate immunity receptors and produce distinct inflammatory reactions, which can be protective to contain microbial invasion, or pathogenic to cause tissue damage and shock syndrome in the host. The book shares lessons learned from state-of-the art research in this field, highlights the latest discoveries, and provides insightful discussions on lectin-mediated inflammatory reactions, while also outlining future research directions. Published since 1959, International Review of Neurobiology is a well-known series appealing to neuroscientists, clinicians, psychologists, physiologists, and pharmacologists. Led by an internationally renowned editorial board, this important serial publishes both eclectic volumes made up of timely reviews and thematic volumes that focus on recent progress in a specific area of neurobiology research. With recent advancements in new knowledge, it has become evident that psychostimulants and related drugs of abuse are influencing our central nervous system (CNS) remarkably and could alter their function for a longtime. This volume is the first to focus on substance abuse induced brain pathology in the widest sense as it covers alterations in neuronal, glial and endothelial cell functions under the influence of acute or chronic usage of substance abuse. ***reference for both pure and applied scientists working in the fields of microbiology and biochemistry. This handbook provides basic facts regarding foodborne pathogenic microorganisms and natural toxins. The introduction of synthetic organic chemicals into the environment during the last few decades has given rise to major concern about the ecotoxicological effects and ultimate fate of these compounds. The pollutants that are considered to be most hazardous because of their intrinsic toxicity, high exposure level, or recalcitrant behavior in the environment have been placed on blacklists and other policy priority lists. The fate of synthetic compounds that enter the environment is mainly determined by their rate of biodegradation, which therefore also has a major effect on the degree of bioaccumulation and the risk of ecotoxicological effects. The degree and rate of biodegradation is also of critical importance for the feasibility of biological techniques to clean up contaminated sites and waste streams. The biodegradation of xenobiotics has thus been the subject of numerous studies, which resulted in thousands of publications in scientific journals, books, and conference proceedings. These studies led to a deeper understanding of the diversity of biodegradation processes. As a result, it has become possible to enhance the rate of degradation of recalcitrant pollutants during biological treatment and to design completely new treatment processes. At present, much work is being done to expand the range***

What is science for a child? How do children learn about science and how to do science? Drawing on a vast array of work from neuroscience to classroom observation, Taking Science to School provides a comprehensive picture of what we know about teaching and learning science from kindergarten through eighth grade. By looking at a broad range of questions, this book provides a basic foundation for guiding science teaching and supporting students in their learning. Taking Science to School answers such questions as: When do children begin to learn about science? Are there critical stages in a child's development of such scientific concepts as mass or animate objects? What role does nonschool learning play in children's knowledge of science? How can science education capitalize on children's natural curiosity? What are the best tasks for books, lectures, and hands-on learning? How can teachers be taught to teach science? The book also provides a detailed examination of how we know what we know about children's learning of science--about the role of research and evidence. This book will be an essential resource for everyone involved in K-8 science education--teachers, principals, boards of education, teacher education providers and accreditors, education researchers, federal education agencies, and state and***

Entries combine phylogenetic and systematic data with insights into genetics, physiology and application. Existing entries have been revised to incorporate rapid progress and technological innovation. The new edition improves on the lucid presentation, logical layout and abundance of illustrations that readers rely on, adding color illustration throughout. Expanded to seven volumes in its print form, the new edition adds a new, searchable online version. The Bad Bug Book 2nd Edition, released in 2012, provides current information about the major known agents that cause foodborne illness. Each chapter in this book is about a pathogen—a bacterium, virus, or parasite—or a natural toxin that can contaminate food and cause illness. The book contains scientific and technical information about the major pathogens that cause these kinds of illnesses. A separate “consumer box” in each chapter provides non-technical information, in everyday language. The boxes describe plainly what can make you sick and, more***
